NiuBi (NB)

WHITEPAPER

Version 1.0 · BEP-20 Token on BNB Smart Chain · October 2026

Abstract

NiuBi (NB) is a BEP-20 token deployed on BNB Smart Chain. The protocol embeds its entire economic policy inside the smart contract: a 6% buy tax and a 10% sell tax are split between marketing, automatic liquidity provision, automatic token burn and BNB dividends for holders. Additional protections — anti-whale limits and a trade cooldown — are enforced on-chain and cannot be bypassed by users.

The contract source code is publicly verified on BscScan, all taxes are hard-coded at deployment, and the PancakeSwap liquidity provider (LP) tokens have been sent to the dead address, making the initial liquidity permanently irremovable.

1. Introduction

Most tokens launched on decentralized exchanges fail their earliest buyers for the same reasons: liquidity is pulled without warning, tax rules change after purchase, or a few wallets accumulate enough supply to move the price at will. NiuBi was designed around contract-level constraints that remove the ability for anyone — including the deployer — to break these rules silently.

The design goals of NiuBi are:

- **Predictability.** Fee structure and limits are fixed in the contract and visible to everyone before purchase.
- **Permanent liquidity.** LP tokens are burned, so exiting liquidity can never be used as an exit scam.

- **Aligned incentives.** Every trade simultaneously funds liquidity, reduces supply and rewards holders.
- **Bot resistance.** Sniping and sandwich attacks are mitigated through a cooldown and transaction caps.

2. Token Overview

Parameter	Value
Token name	NiuBi
Symbol	NB
Blockchain	BNB Smart Chain (BSC), Chain ID 56
Token standard	BEP-20
Decimals	18
Total supply	1,000,000,000 NB (fixed at deployment)
Contract address	`0xa9A69321F5fB01858702eF4Ae6d73364c3aa2148`
Primary DEX	PancakeSwap V2 (NB / BNB pair)
Router	`0x10ED43C718714eb63d5aA57B78B54704E256024E`
Source code	Verified on BscScan
Liquidity status	LP tokens burned to `0x...dEaD`

3. Tokenomics

Total supply is fixed at 1,000,000,000 NB. There is no mint function, no inflation and no hidden treasury allocation controlled by the deployer. Circulating supply only decreases over time, because part of every transaction is burned.

3.1 Buy Tax — 6%

Allocation	Rate	Function
Marketing	2.5%	Project operations and promotion
Liquidity	2.0%	Automatically added to the NB/BNB pool
Burn	1.0%	Sent to the dead address permanently
Dividend	0.5%	Redistributed to holders in BNB
Total	**6.0%**	

3.2 Sell Tax — 10%

Allocation	Rate	Function
Marketing	4.5%	Project operations and promotion
Liquidity	3.0%	Automatically added to the NB/BNB pool
Burn	2.0%	Sent to the dead address permanently
Dividend	0.5%	Redistributed to holders in BNB
Total	**10.0%**	

> The contract owner, the liquidity pair and the dead address are excluded from fees, limits and dividends. These exclusions are written in the constructor and cannot be altered afterwards.

3.3 Trading Limits

Limit	Value	Share of supply
Maximum transaction	5,000,000 NB	0.5%
Maximum wallet holding	15,000,000 NB	1.5%
Swap-and-liquify threshold	1,000,000 NB	0.1%
Trade cooldown	60 seconds	—

4. Protocol Mechanics

4.1 Automatic Liquidity

When the accumulated liquidity allocation reaches the swap threshold, the contract sells half of that amount for BNB and pairs the remainder with it, adding the resulting liquidity to PancakeSwap. This continuously deepens the pool without any manual intervention and without withdrawing value from the pool.

4.2 Automatic Burn

The burn allocation of every qualifying transaction is transferred to `0x000000000000000000000000000000000000dEaD`. Burned tokens are removed from circulation permanently and can never be recovered by any party.

4.3 Holder Dividends

The dividend allocation is accumulated and distributed in BNB to all eligible holders using a proportional accumulator (the same model popularised by reflection-style tokens). A holder's claim grows with both the dividend volume generated by trading and the size of their balance. No staking, locking or claim transaction is required.

4.4 Anti-Whale and Anti-Bot

Every wallet is subject to the transaction and holding caps listed in section 3.3. During the launch period, a 60-second cooldown between transfers from the same wallet prevents high-frequency sniping and automated sandwich strategies. These limits are enforced inside `_transfer`, so they apply equally to all non-excluded addresses.

4.5 Permanent Liquidity Lock

The PancakeSwap LP tokens received when liquidity was created were transferred to the dead address. As a result, no address holds the LP position and liquidity can never be removed — the pool remains tradable for as long as BNB Smart Chain exists.

5. Security and Transparency

- **Verified source code.** The full Solidity source is published and verified on BscScan, allowing anyone to audit the tax logic, limits and ownership functions.
- **Fixed parameters.** Buy and sell tax rates are set at deployment; they are not exposed through an owner-adjustable setter.
- **No minting.** Total supply cannot be increased after deployment.
- **Burn-only treasury.** The project holds no privileged token allocation beyond the owner's publicly visible wallet balance.

- **On-chain verification.** Tradability was enabled by a public transaction, and every state change is observable on BscScan.

6. Roadmap

Phase	Scope	Status
Phase 1 Foundation	Contract development and deployment, source verification, PancakeSwap liquidity creation, LP burn	Completed
Phase 2 Visibility	Official website, whitepaper, English documentation, BscScan token information and logo update, community channels	In progress
Phase 3 Discovery	Listings on token data aggregators (CoinGecko, CoinMarketCap), broader community growth and content marketing	Planned
Phase 4 Expansion	Additional utility and ecosystem features, prioritised through community discussion	Planned

Roadmap items describe intentions, not guarantees. Timelines depend on community growth, market conditions and the outcome of third-party listing reviews.

7. How to Acquire NB

1. Install a BNB Smart Chain compatible wallet such as MetaMask and fund it with BNB.
2. Switch the wallet network to BNB Smart Chain mainnet (Chain ID 56).
3. Open PancakeSwap and import the NB contract address as the output token.
4. Set slippage to 8% or higher for buys and 12% or higher for sells, then confirm the swap.

Contract address for import:

```
0xa9A69321F5fB01858702eF4Ae6d73364c3aa2148
```

8. Risk Disclosure

NiuBi is a decentralized, community-oriented token with no venture capital backing, no guaranteed revenue model and no expectation of profit derived from the efforts of others. Before interacting with the contract, readers should understand the following risks:

- **Market risk.** The price of NB is determined entirely by supply and demand on decentralized exchanges and may fall to zero.

- **Liquidity risk.** Although the initial LP position is burned, a small pool produces high slippage and volatility; large orders may not be executable at a fair price.
- **Smart contract risk.** Despite verification and review, undiscovered defects or unexpected interactions with third-party protocols remain possible.
- **Tax risk.** A 6% buy tax and a 10% sell tax apply to every trade. These amounts are permanently deducted and must be accounted for before trading.
- **Regulatory risk.** The legal treatment of digital assets differs by jurisdiction and may change without notice.
- **No recourse.** Blockchain transactions are irreversible. Lost funds, mistyped addresses and failed transactions cannot be reversed by the project or by anyone else.

Nothing in this document is investment advice, a solicitation, or an offer to sell securities in any jurisdiction. Every reader is responsible for their own due diligence and for compliance with the laws that apply to them.
